National Maritime Climate Action in 5 Sub-Saharan African Countries

Simon CHIN-YEE, UCL, Political Sciences

IMO Conference on Low-Carbon Shipping Mombasa, 5 May 2023
Decarbonisation of Maritime Sector

Consortium:
University College London
World Bank
Global Maritime Forum Foundation
SADC Centre for Renewable Energy and Energy

The decarbonisation of shipping is a key opportunity that can combine climate change mitigation, adaptation policy and economic development.

- 2 years in the making, this a chance to both ‘green’ the maritime sector in Eastern and Southern African countries, while growing the sectors, all of which are important for the 5 target countries economies.

Overall objective: to reduce greenhouse gas emissions in the maritime sector, both through enabling countries to take further mitigation actions at a national level as well as exploring the adoption of ambitious climate measures at the International Maritime Organisation (IMO).

The objectives of this project will be achieved by enhancing in-country capacity and supporting the development of national strategies that are tailored to the individual circumstances of each of the five countries and integrate both the domestic/national and international components of a maritime decarbonisation transition.

To realise the outcome, we have designed six work packages:

1. Establishing a National Low-Carbon Shipping Committee
2. Assessing the countries’ maritime sector and emissions
3. Developing NAPs
4. Implementing NAPs
5. Including domestic shipping in countries’ NDCs
6. Supporting active and ambitious participation of the countries at the IMO.
Context: shipping decarbonisation
IPCC: Halving emissions by 2030
IPCC AR6 defines budgets for avoiding exceeding 1.5°C, SBTi – aligning shipping for rapid reductions in GHG emissions

MEPC 79/INF.29 and INF.30

SBTi
ISWG-GHG 13/3/3, INF
Softer 2030 = harder 2040

Domestic shipping and fishing, will likely take a different pathway and move to efficiency, wind assistance and electrification

*with equal importance
The Africa Advantage

- Over the coming years, Africa will develop its energy infrastructure.
- However, fossil fuel-based energies are not compatible to limiting global warming to 1.5°C as set out in the Paris Agreement – but many countries are still reliant on coal and gas.
- This is an extraordinary opportunity for countries to leapfrog dependence on fossil fuels straight to renewables.
- We already see this happening: Kenya - renewable energy currently accounts for 73% of installed power generation capacity while 90% of electricity in use is from green sources: geothermal, wind, solar, hydro-electric installation.
- This projects wants to see these renewable sources used in the Maritime/Shipping sector.
- The importance of the maritime shipping industry in Africa cannot be understated, in particular, Both domestic economy and intercontinental trade.
  - International: EU, US, China and new markets will open up (expansion of economic possibilities)
  - Domestic: smaller scale shipping, fishing vessels, sustainable local industry
- The African continent has a huge advantage with its abundant natural energy resources: wind, water, solar
- Renewable technologies have become more efficient and cost-effective – We see enormous potential for Africa’s shipping industry to benefit from these renewable energies (wind and solar).
**Partner Countries**

**Comoros**
- Poor transport connectivity, high transport costs
- Opportunity to implement measures to increase energy efficiency and reduce fuel consumption
- Expressed interest in wind propulsion solutions
- SIDS, LDC → importance at IMO

**Kenya**
- Member of High-Level Plan for a Sustainable Ocean Economy, leading development of Blue Economy
- IMO Council Member, hosts MTCC, leadership in UNFCCC
- Large green hydrogen production potential
- Mombasa: important int'l port

**Mauritius**
- Aims to become global bunkering hub
- Excess renewable energy resources
- Could leapfrog fossil fuel infrastructure development and become hydrogen-based bunkering hub
- SIDS → importance at IMO

**Namibia**
- Member of High-Level Plan for a Sustainable Ocean Economy
- Considered a frontrunner for becoming green hydrogen champion (large potential for cheap green hydrogen production)
- Hosts SACREEE, one of the consortium members

**Tanzania**
- Large green hydrogen production potential
- Dar es Salaam: important int'l port
- Identified as one of the countries in Africa for the 1st large-scale hydrogen projects and basis for expansion into Africa
- SIDS, LDC → importance at IMO
Leadership Potential

All five countries have the potential to become leaders in modernising and decarbonising the maritime industry, not just on the Continent, but globally.

- Kenya and Namibia are already both members of the High-Level Plan for a Sustainable Ocean Economy
- Namibia, Kenya and Tanzania have large green hydrogen production potential
- Comoros has an interest in wind propulsion solutions
- Mauritius aims to become a global bunkering hub. With the use of renewable energy resources, it is in the position to bypass the development of fossil fuels bunkering infrastructure and instead invest in developing green hydrogen-based bunker fuel production and bunkering facilities.

This project will learn from and support these initiatives – there is a need for technical and financial investment in these areas.

The desired outcome is for these 5 countries to become leaders in decarbonisation of the maritime sector.

Moreover, there are significant, sustainable, socio-economic development opportunities related to maritime decarbonisation.

Build the Maritime sector while moving to green energies and modernising technologies.
• Many countries have the potential for renewable energy provision, particularly Africa, creating national opportunity for domestic and international fleet decarbonization, and wider development and export potential.
Challenges

• The reliance on fossil fuels and older technologies/ships.
• They are heavily dependent on the shipping industry to meet their socio-economic needs.
  • Global food security identified Kenya and Tanzania as having high exposure to maritime food supply chokepoints with no alternative routes
  • Comoros imports 70% of its food and suffers from poor transport connectivity
• Some of the highest international maritime transport costs.
• Adaptation/Climate Strategies - adapting to, and managing the impacts of, climate change are key, but do not necessarily address maritime GHGs.
  • Not currently in countries’ NDCs or maritime strategies (the focus is on land)
• Policy gap between the current status quo and the possibility of realising transformational mitigation of maritime GHG emissions.
• Under Representation: Historically underrepresented in IMO and UNFCCC – this is changing! But as leaders, a greater voice is required in these global regimes.

Domestic and international shipping’s decarbonization will be capital intensive (for land and fleet). Climate finance is likely an important source of capital for some countries
Key components of overall work to undertake

- Initial studies and data collection on domestic and international shipping (composition and inventory) – identify further data collection needs
- Identify national ‘low-carbon shipping’ committee members for each country, understand existing structures for participation in IMO debates
- NAP descriptions and exploration of country priorities

- Identify possible pilot/trial project concepts
- Introductions to, and relationship building to overlapping activities
  - Wider IKI projects
  - Other relevant initiatives (UNF, other GMF etc.)
- Implementation phase risk classification and mitigation
COP27 Workshop - Nov 2022

- First time to bring partner countries and consortium together
- Discuss pathways forward
- Look at existing national maritime action plans
- Identify data on maritime emissions in the region (shipping, ports)
- Linking of different ministries for the partner countries (climate, energy, transport etc.)
- Discussion of importance of maritime sectors in the partner countries
Thank you for attention
Come say hi!

Where are we?

Develop final proposal to match capacity/costs re: budget

Building Project Capacity:

- The importance of ALL partners cannot be underestimated
  - Identify key players in Maritime sector
  - Identify key researchers to work with us and the relevant ministries
  - Develop relation with relevant ministries
  - Focal point and research assistant for different stakeholders

- Building consortium capacity
  - In the consortium team – availability, what is needed in this phase

- Capacity in target countries – Have core team members in each country ready for implementation phase

- Undertaking detailed analysis and quantification of the national/international shipping activity in each of the 5 countries

- IMO & UNFCCC negotiations – identify need for training and capacity in IMO negotiations and the link to climate policy (NDCs)

- Accelerating capacity development and knowledge production in specific areas related to maritime activity

- Potential pilot projects (subject to costs) with partner countries
  - what exists, what is needed, resource availability,
Clarity of IMO demand for clean hydrogen can contribute to equitable transition in many developing countries

Select announcements of projects:

- **Namibia** – Hyphen intends to produce 300,000 tonnes of green hydrogen per annum at full development. The first phase of the project, expected to come online by 2026 will result in the production of 125,000 tonnes. The total investment of the project is expected to be $10 Billion.

- **Mauritania** – Aman intends to produce 1.7 million tonnes of green hydrogen per annum at full development. The total investment of the project is $40 billion.

- **South Africa** - Hive intends to produce 0.78 million tonnes of green ammonia per year, with first-phase production is expected to begin in 2026.

- **Morocco** – Amun intends to produce 350,000 to 400,000 tonnes of green hydrogen annually to be converted to green ammonia.

Source: Masdar – Africa’s Green Energy Revolution (2022)
Shipping’s new fuels will be produced from gas, biomass and renewable energy and require wide-scaled changes to fleet and energy supply chains.
In 2022/23, announcements of pilots/trials to develop and test new fuels for shipping are growing rapidly – so far mostly in developed world. This project will look to enable similar opportunities in target countries.
