## Interim National Action List for offshore carbon dioxide sequestration

Australian Government

Department of Climate Change, Energy,  
the Environment and Water

# Development of Australia's National Action List for offshore CCS

London Protocol Science Day

18 April 2024

### Presenters

**Heather Agnew**

Director, Sea Dumping  
Department of Climate Change,  
Energy, the Environment and Water

**Dr Andrew Ross**

Sr. Principal Research Scientist  
Commonwealth Scientific and  
Industrial Research Organisation

**Dr Linda Stalker**

Sr. Principal Research Scientist  
Commonwealth Scientific and  
Industrial Research Organisation

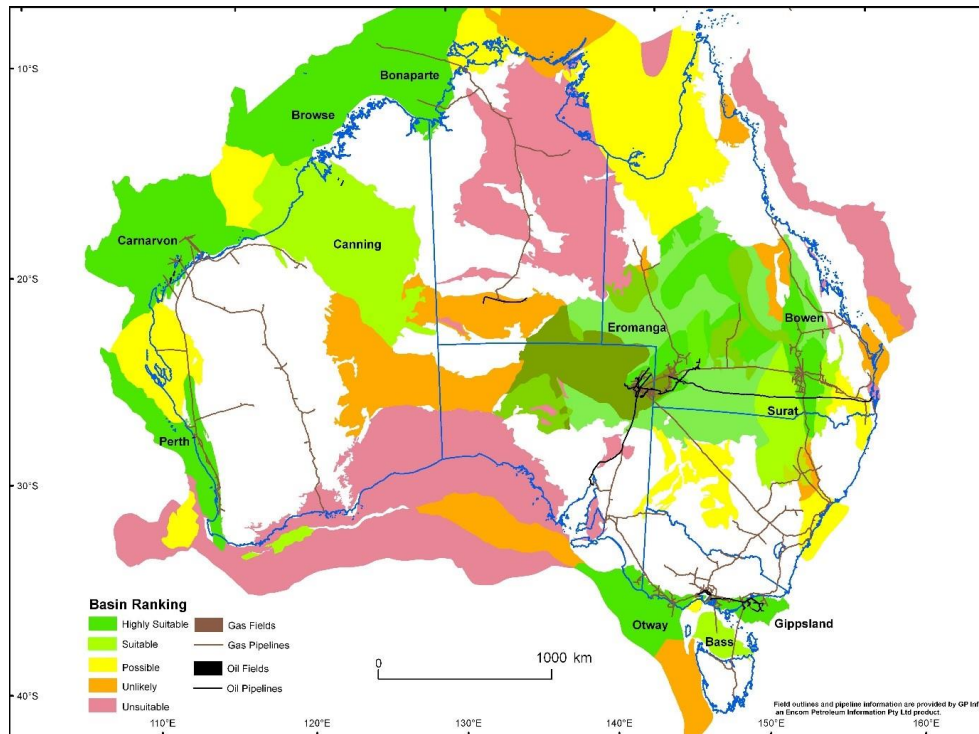

# Presentation outline

- Snapshot: CCS in Australia
- Australian context
- Australia's National Action List
- CSIRO – technical development of the National Action List
- Looking forward - National Action List

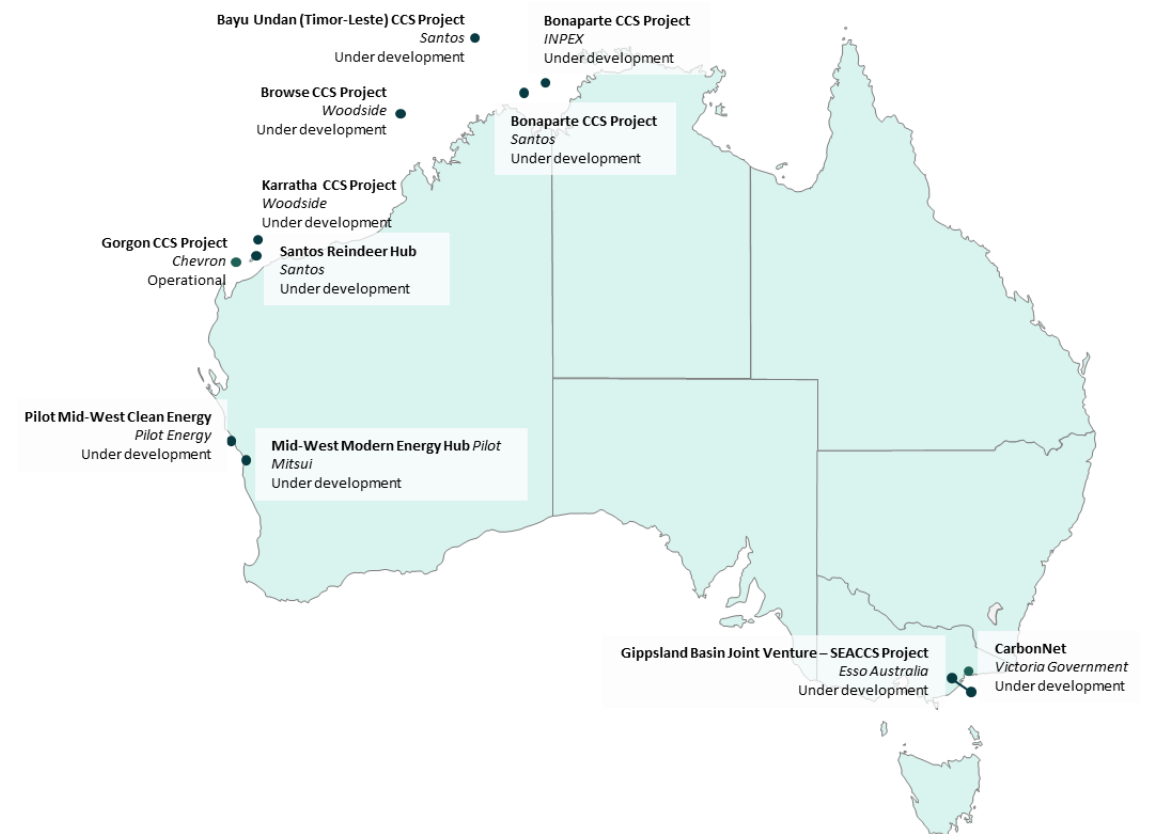

# Snapshot: CCS in Australia

## Australia's operational CCS project and developing offshore CCS projects

Australia's basins ranked for CO<sub>2</sub> storage potential (National Carbon Mapping and Infrastructure Plan, 2009, Figure 18)

# Australian context

## International Agreements

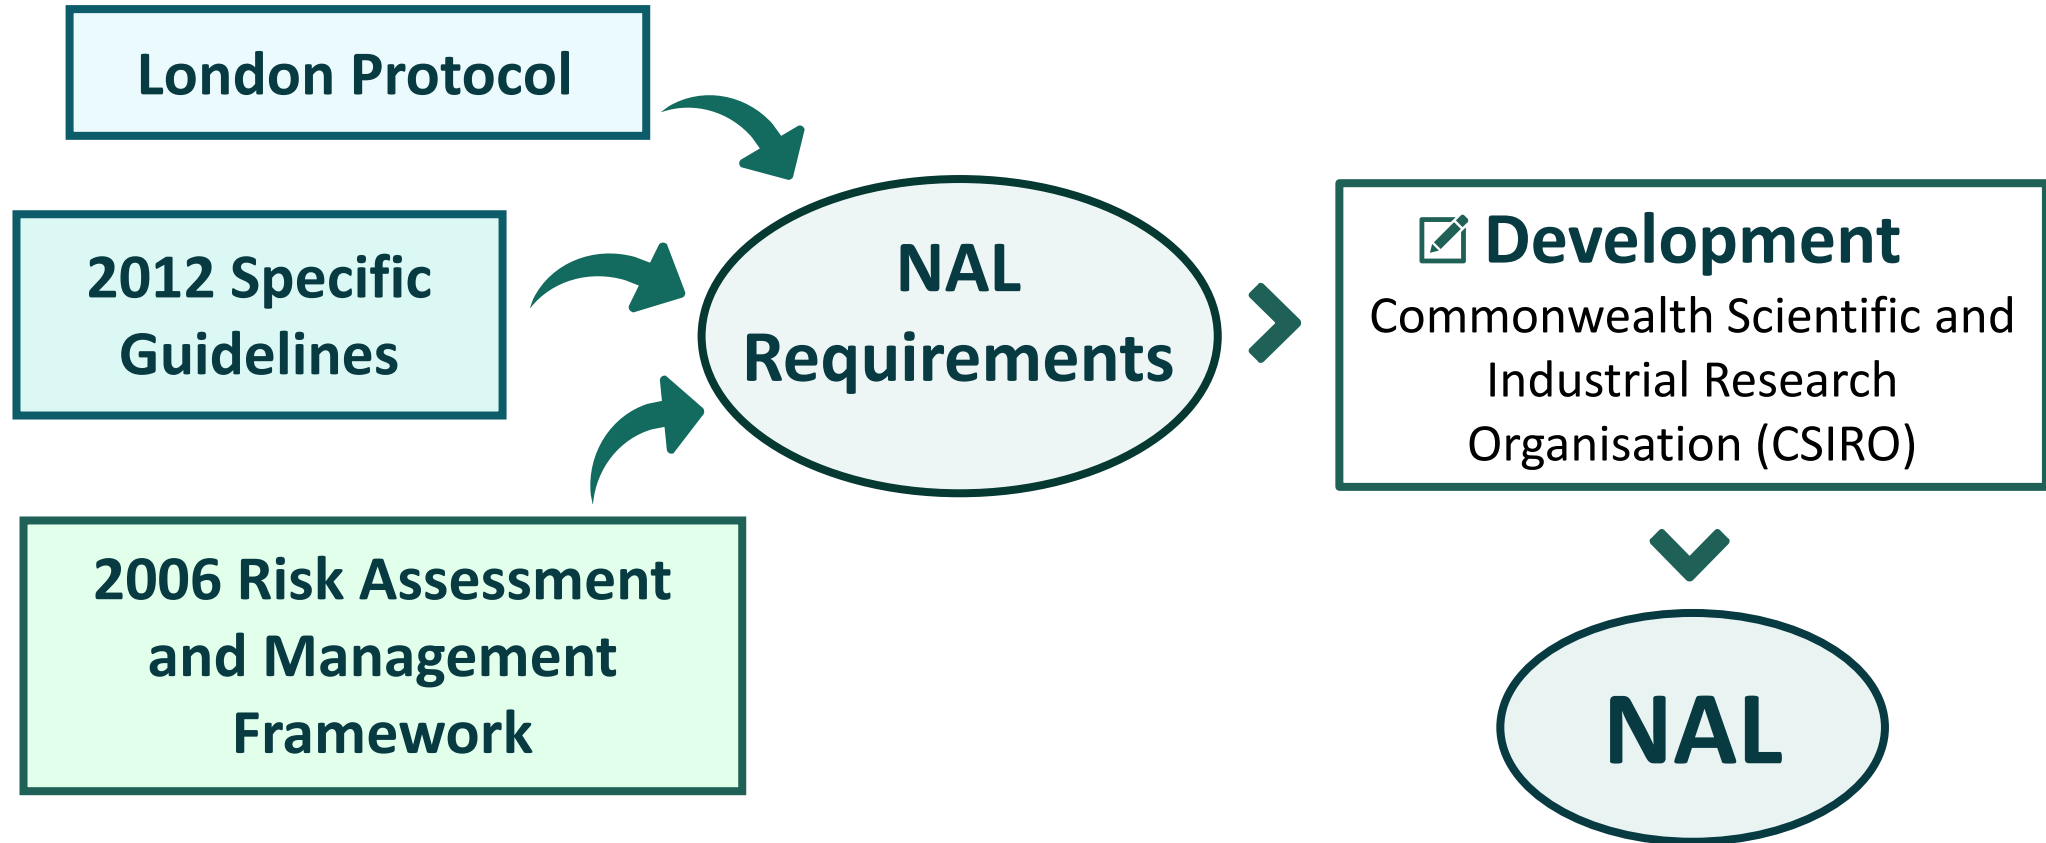

- The London Protocol

## National Law

- *Environment Protection (Sea Dumping) Act 1981*
- *Environment Protection and Biodiversity Conservation Act 1999*
- *Offshore Petroleum and Greenhouse Gas Storage Act 2006*

# National Action List (NAL) requirements

# Australia's National Action List

## Interim NAL for CCS

- sets out a list of specified substances for which the waste would need to be screened
- sets an upper-limit threshold for each substance
- is available on our department's website [www.dcceew.gov.au](http://www.dcceew.gov.au)

## NAL for CCS

- may specify a lower-level substance concentration, below which there is little concern
- consider more types of capture scenarios

Department website

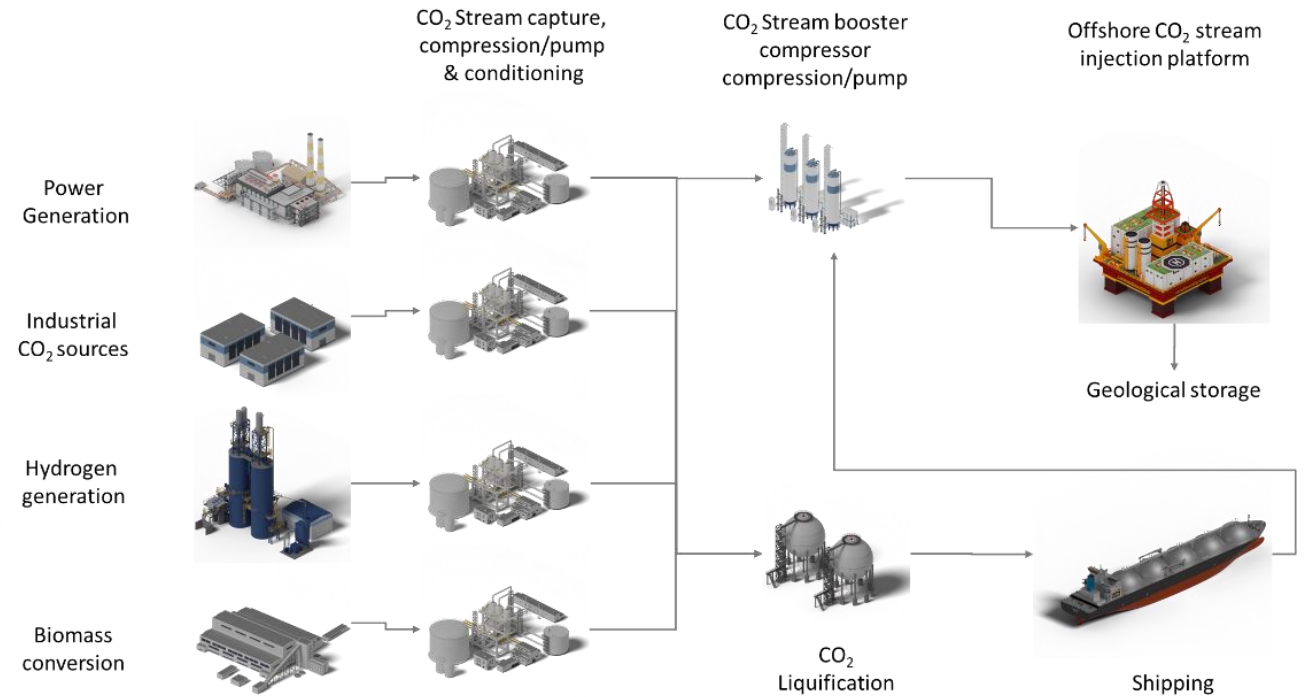

Cover – Interim National Action List for offshore carbon dioxide sequestration

# Carbon Capture and Storage Value Chain

Traditional CCS concept

Current concepts

# Defining upper-limits for the Interim NAL

- Tracking CO<sub>2</sub> and Incidental Associated Substances through the value chain
- Benchmarking against ISO transport standards and CCS project CO<sub>2</sub> specifications
- Comparison with Human Health Short Term Exposure Limits (STELs)
- Measurement
- Interim NAL construction

Tracking Incidental Associated Substances

# Combustion and industrial processes CO<sub>2</sub> streams

- Australian energy and industry focus
- **Combustion**
  - Coal, gas biomass and waste
- **Industrial processes**
  - Cement/lime
  - Metal smelters
  - Chemicals
  - Ammonia and fertiliser production

Tracking Incidental Associated Substances

# CO<sub>2</sub> capture and conditioning

- **Preconditioning**
  - Removal of compounds such as NO<sub>x</sub> SO<sub>x</sub> Hg
- **Amine-based CO<sub>2</sub> capture**
- **Postconditioning**
  - Dehydration, amine removal

Incidental Associated Substances are removed during capture and conditioning

Collated CO<sub>2</sub> contaminants from industrial sectors flue gas and CO<sub>2</sub> product streams

Tracking Incidental Associated Substances

# Concentrations of impurities in dried CO<sub>2</sub>

- Concentrations of Incidental Associated Substances in dried CO<sub>2</sub> (post capture and purification)
- Ranges of Incidental Associated Substance concentrations in CO<sub>2</sub> streams

Constituent	Concentrations from combustion of thermal coal (%)		Concentrations from combustion of gas (%)	
Carbon Dioxide (CO <sub>2</sub> )	98.84 – 99.97		98.78 – 99.97	
Carbon Monoxide (CO)	0.001 – 0.04	(10 – 400 ppm)	<DL - 0.0050	(<DL - 50 ppm)
Nitrogen (N <sub>2</sub> )	0.01 – 0.9	(100 – 9,000 ppm)	0.01 – 0.9	(100 – 9,000 ppm)
Argon (Ar)	0.01 – 0.15	(100 – 1,500 ppm)	0.01 – 0.15	(100 – 1,500 ppm)
Oxygen (O <sub>2</sub> )	0.01 – 0.03	(100 – 300 ppm)	0.01 – 0.03	(100 – 300 ppm)
Sulphur Dioxide (SO <sub>2</sub> )	0.001 – 0.01	(10 – 100 ppm)	0.001 – 0.01	(10 – 100 ppm)
Nitrogen Oxides (NO <sub>x</sub> )	<DL – 0.01	(<DL – 100 ppm)	<DL - 0.01	(<DL - 100 ppm)
Hydrogen (H <sub>2</sub> )	<DL – 0.002	(<DL – 20 ppm)	<DL – 0.01	(<DL – 100 ppm)
Hydrogen Sulphide (H <sub>2</sub> S)	<DL – 0.01	(<DL – 100 ppm)	<DL – 0.01	(<DL – 100 ppm)
Water (H <sub>2</sub> O)	0.001 – 0.06	(10 – 600 ppm)	0.001 – 0.06	(10 – 600 ppm)
Methane (CH <sub>4</sub> )	<DL – 0.01	(<DL – 100 ppm)	<DL – 0.01	(<DL – 100 ppm)
Ammonia (NH <sub>3</sub> )	<DL – 0.005	(<DL – 50 ppm)	<DL – 0.005	(<DL – 50 ppm)
Methanol (CH <sub>3</sub> OH)	<DL – 0.02	(<DL – 200 ppm)	<DL – 0.02	(<DL – 200 ppm)

Sourced from Wang et al., 2011a; Metz et al., 2005

DL indicates 'lower than detection limit' of analytical method used for determination, this does not however mean that the compounds are not present.

# Composition from industries pre- and post-capture

- Concentration ranges of Incidental Associated Substances in CO<sub>2</sub> streams pre- and post-capture
- Collated for the range of industrial and combustion CO<sub>2</sub> sources

this shows how many data points are available for the industry waste stream i.e. 27 for SO<sub>x</sub>

1 | ND ..... PFC-14  
1 | ND ..... PFC-218  
27 | 2 ..... SO<sub>x</sub>

this shows how many data points are available for the post capture stream i.e. 2 for SO<sub>x</sub>

# Benchmarking against CO<sub>2</sub> specifications

- ISO 27913
- CCS projects
  - Sleipner
  - Hynet
  - Weyburn
  - Acorn and related Scottish cluster projects
  - Northern Territory low emission hub
  - Northern Lights
  - Porthos Project
  - DeepC Store

**INTERNATIONAL ISO**

**Cadent**

Future Hydrogen Sources  
Future CO<sub>2</sub> Shipping  
CO<sub>2</sub> Storage  
Future Gas  
Hydrogen Trains  
Hydrogen Fuelling  
Manchester

— H<sub>2</sub> Pipeline  
— CO<sub>2</sub> Pipeline  
— Existing Gas Distribution Network

**World class CO<sub>2</sub> stores**  
Two large, well understood CO<sub>2</sub> stores with plenty room for growth.

**Pipeline reuse**  
More than £750 million cost savings from reuse of high capacity on and offshore pipelines.

**Low cost CO<sub>2</sub>**  
200,000 tonnes of existing, easy to capture CO<sub>2</sub> from the St Fergus Gas Terminals.

**CO<sub>2</sub> from H<sub>2</sub> production hub**  
Around 35% of all UK natural gas comes onshore at St Fergus - an ideal site for a major H<sub>2</sub> production hub. H<sub>2</sub> at St Fergus can be fed directly into the gas grid from blending and reconditioning gas.

**CO<sub>2</sub> from Grangemouth cluster and beyond**  
CO<sub>2</sub> from Grangemouth cluster piped to St Fergus through Fender 10 - a natural gas pipeline new route.

**Northern Lights**  
- Industrial decarbonisation, CO<sub>2</sub> storage for Europe

Image of CStore1

# Capture and CO<sub>2</sub> specifications comparison

- Comparison of CO<sub>2</sub> stream pre and post capture with CO<sub>2</sub> specifications
- Shows many specifications are in line with expected post capture composition
- However there are exceptions

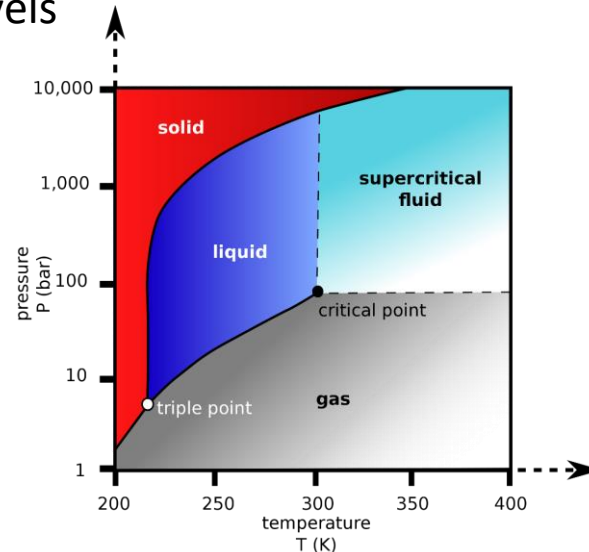

# Short Term Exposure Limits (STELs)

Assessing the risk of CO<sub>2</sub> stream contaminants

- Contaminant toxicity
- Pathway to harm
- Risks to workers
- Risks to the environment
- Use of screening levels

## Considerations of CO<sub>2</sub> phase

# Measurement

## Review of CO<sub>2</sub> stream monitoring approaches

- Inline measurement methods
- Offline measurement methods
  - Mobile methods and instruments
  - Laboratory based techniques

Further method development required

Contaminant	Online Methods and Instrumentation				Mobile Methods and Instrumentation				Laboratory Based Techniques			
	Instrument Type	Supplier	Lower Limit	Method	Instrument Type	Supplier	Lower Limit	Method	Instrument Type	Supplier	Lower Limit	Method
Mercury	Online subsampling; UV absorbance / UV Fluorescence	Various	0.1 µg/m <sup>3</sup>	Relevant Standard: ISO 6979-2:2003 (Detection in Natural Gas Streams)	Portable Mercury Analyser	Ion - MVI	0.1 µg/m <sup>3</sup>	USEPA OTM-31: Guide for Developing a Multi-Metals, Fence-Line Monitoring Plan for Fugitive Emissions Using X-Ray Based Monitors	Ultraviolet Atomic Fluorescence (UV AF), ultraviolet atomic absorption (UV AA), X-ray Fluorescence (XRF)	Various	0.1 µg/dscm (dry standard cubic metre)	USEPA Method 308

# Interim NAL

- CO<sub>2</sub> Streams for storage to comprise >95% CO<sub>2</sub>
- STELs with safety factor included used to define upper limits of Incidental Associated Substances
- Incidental Associated Substances without STELs are included that relate to:
  - Infrastructure integrity
  - Subsurface reactivity
  - Efficiency

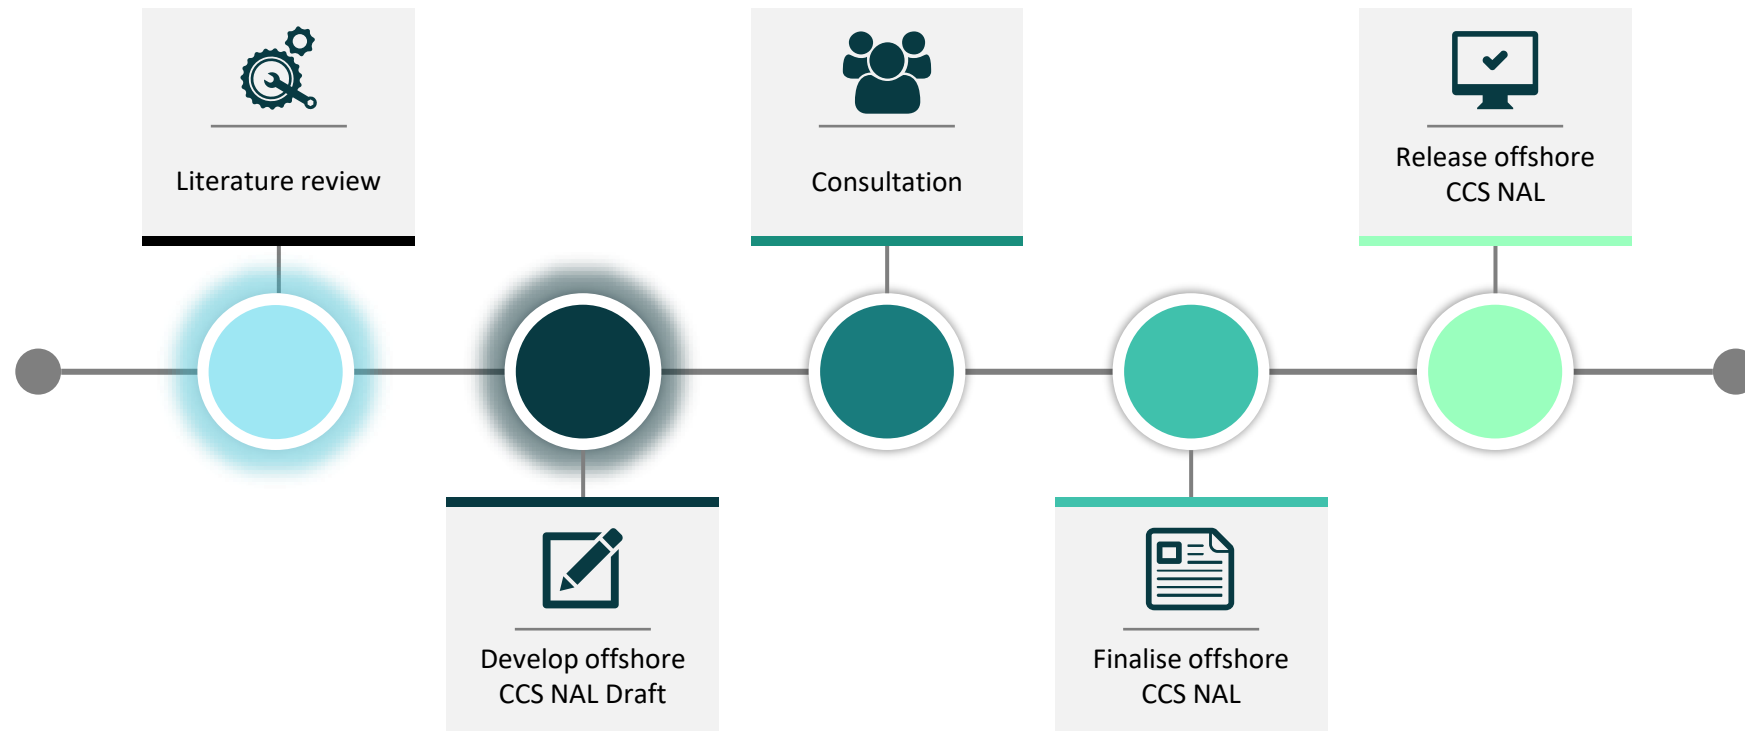

Adjustments will occur where required for offshore CCS NAL release

Contaminant	Upper Limit	Rationale for Limit
CO (carbon monoxide)	2,000 ppm	<ul style="list-style-type: none"> <li>• Health and safety aspects</li> <li>• Engineering with respect to mitigation of stress cracking of steels due to carbide formation</li> </ul>
COS (carbonyl sulphide)	100 ppm	<ul style="list-style-type: none"> <li>• Health and safety aspects</li> </ul>
H <sub>2</sub> S (hydrogen sulphide)	200 ppm	<ul style="list-style-type: none"> <li>• Health and safety aspects</li> <li>• Engineering with respect to mitigation of stress cracking of steels due to hydride formation</li> </ul>
HCl (hydrogen chloride)	40 ppm	<ul style="list-style-type: none"> <li>• Health and safety aspects</li> <li>• Engineering with respect to mitigating metal corrosion</li> <li>• Environmental with concerns about dissolution of carbonate minerals, especially in sub-surface rock formations or well-bore cements due to acidic nature of HCl in water (forms hydrochloric acid)</li> </ul>
HF (hydrogen fluoride)	10 ppm	<ul style="list-style-type: none"> <li>• Health and safety aspects</li> <li>• Engineering with respect to mitigating metal corrosion</li> <li>• Environmental with concerns about dissolution of carbonate or silicate-rich minerals, especially in sub-surface rock formations or well-bore cements due to acidic nature of HF in water (forms hydrofluoric acid)</li> </ul>
CH <sub>3</sub> OH (methanol)	4,000 ppm	<ul style="list-style-type: none"> <li>• Health and safety aspects</li> </ul>
NH <sub>3</sub> (ammonia)	700 ppm	<ul style="list-style-type: none"> <li>• Health and safety aspects</li> <li>• Engineering with respect to mitigation of stress cracking of steels due to hydride formation and corrosion of copper-based alloys</li> </ul>
NO <sub>x</sub> (nitrogen oxides)	4 ppm	<ul style="list-style-type: none"> <li>• Health and safety aspects</li> <li>• Engineering with respect to mitigating metal corrosion</li> <li>• Environmental with concerns about dissolution of carbonate minerals, especially in sub-surface rock formations or well-bore cements due to acidic nature of NO<sub>x</sub> in water (forms nitrous and nitric acids)</li> <li>• Microbiological with respect to any nitrites and nitrates (formed by the acid reaction) acting as electron acceptors in the anaerobic sub-surface formations with multi-step reductions to nitrous oxide (N<sub>2</sub>O, small amounts) and nitrogen (N<sub>2</sub>, main product)</li> <li>• Chemical with respect to possible reaction with other contaminant species to form new compounds</li> </ul>
