Distr.
GENERAL

A XII/Res.466
19 March 1982

Original: ENGLISH

ASSEMBLY - 12th session
Agenda item 10(b)

RESOLUTION A.466(XII)
adopted on 19 November 1981

PROCEDURES FOR THE CONTROL OF SHIPS

THE ASSEMBLY,

RECALLING Article 16(i) of the Convention on the Inter-Governmental Maritime Consultative Organization,

RECALLING FURTHER that it had adopted by resolution A.321(IX) Procedures for the Control of Ships under Regulation 19 of Chapter I of the International Convention for the Safety of Life at Sea, 1960, and Article 21 of the International Convention on Load Lines, 1966,

NOTING that the Maritime Safety Committee as requested in resolution A.321(IX) prepared the document entitled "Sub-standard Ships: Guidelines on Control Procedures" (MSC/Circ. 219),

RECALLING ALSO that with resolution A.390(X) it had urged Governments of flag States to submit information about action taken in respect of ships entitled to fly the flag of their State which were reported as not complying fully with the requirements of the above Conventions,

REAFFIRMING its desire to ensure that ships comply at all times with maritime safety standards prescribed by relevant conventions,

HAVING NOTED the continuous work of the Maritime Safety Committee on the subject of improving the Procedures for the Control of Ships, including the Guidelines, with reference to the International Convention for the Safety of Life at Sea, 1974,

HAVING CONSIDERED the recommendation made by the Maritime Safety Committee at its forty-third session,

1. ADOPTS the improved Procedures for the Control of Ships and Guidelines thereto contained in the Annex to this resolution, which supersedes the texts set out in the Annex to resolution A.321(IX) and in MSC/Circ.219;
2. INVITES Member Governments and Contracting Governments to the aforementioned Conventions to implement the improved Procedures and Guidelines;
3. REQUESTS Governments concerned to provide information on:
 - (a) The services available in each country for the controlling functions under the relevant Conventions and when necessary to update the information previously submitted;
 - (b) Action taken in respect of ships found to be deficient in relation to the above Conventions in their role as either port or flag State Government;

4. REQUESTS the Maritime Safety Committee to continue its work on this subject with a view to improving the Procedures and Guidelines further as may be necessary and progressively to extend these to cover:

- (a) The Protocol of 1978 relating to the International Convention for the Safety of Life at Sea, 1974;
- (b) The forthcoming amendments to the 1974 SOLAS Convention; and
- (c) Any new conventions;

when experience has been gained with these instruments;

5. FURTHER REQUESTS the Secretariat to update when necessary the information from Member countries on inspection services available domestically and abroad, for circulation to Governments concerned.

ANNEX

PROCEDURES FOR THE CONTROL OF SHIPS

1 Introduction

1.1 Under the provisions of the applicable International Convention for the Safety of Life at Sea and the International Convention on Load Lines, 1966, the Administration (i.e. the Government of the flag State) is responsible for promulgating laws and regulations and for taking all other steps which may be necessary to give these Conventions full and complete effect so as to ensure that, from the point of view of safety of life, a ship is fit for the service for which it is intended.

1.2 In some cases it may be difficult for the Administration to exercise full and continuous control over some ships entitled to fly the flag of its State, for instance those ships which do not regularly call at a port of the flag State. The problem can be, and has been, partly overcome by appointing inspectors at foreign ports or authorizing classification societies to act on behalf of the flag State Administration.

1.3 The following control procedures should be regarded as complementary to national measures taken by Administrations of flag States in their countries and abroad and are intended to assist flag State Administrations in securing compliance with convention provisions in safeguarding the safety of crew, passengers and ships.

1.4 The procedures are intended to apply to ships which come under the provisions of the applicable International Convention for the Safety of Life at Sea and the International Convention on Load Lines, 1966.

1.5 Port States should carry out control of ships of non-convention countries and of ships below convention size, but deficiency reports should be submitted to the Administration of the country concerned and not to the Organization.

1.6 Deficiency reports under the Memorandum of Understanding between certain maritime Administrations or any similar agreement should not be sent to the Organization except if related to IMCO conventions and in conformity with the present procedure.

2 General

2.1 Regulation 19 of Chapter I of the applicable International Convention for the Safety of Life at Sea, and Article 21 of the International Convention on Load Lines, 1966, provide for control procedures to be followed by the Contracting Governments with regard to foreign ships visiting their ports. The authorities of port States should make effective use of these provisions for the purposes of identifying deficiencies, if any, in such ships which may render them sub-standard (see 3.1) and ensuring that remedial measures are taken. Such control may be initiated either:

- .1 by a visit of a control officer of the port State to verify that there are on board valid certificates; or
- .2 on the basis of information regarding a sub-standard ship submitted to the authorities of the port State in accordance with the procedures under section 4.

2.2 Contracting Governments should be aware that whereas they may entrust inspection and survey either to surveyors nominated for this purpose or to organizations recognized by them, it is preferable that the right to board and inspect ships for the purposes of control and the power to detain them should be implemented by government inspectors including those surveyors of the classification societies who, in practice, act as government officials of the port State.

2.3 Guidelines on control procedures are given in Appendix 1.

3 Identification of a sub-standard ship

3.1 In general, a ship is regarded as sub-standard:

3.1.1 if the hull, machinery or equipment such as for life-saving, radio and fire-fighting are below the standards required by the relevant Convention, owing to, *inter alia*:

- .1 the absence of equipment or arrangement required by the conventions;
- .2 non-compliance of equipment or arrangement with relevant specifications of the Conventions;
- .3 substantial deterioration of the ship or its equipment because of, for example, poor maintenance; and

3.1.2 if these evident factors as a whole or individually make the ship unseaworthy and would put at risk the life of persons on board if it were allowed to proceed to sea.

3.2 The lack of valid certificates (or the lack of Radiotelegraph Operator's Certificates or Radiotelephone Operator's Certificates) as required by the relevant Conventions, will constitute *prima facie* evidence that a ship may be sub-standard and will form the basis of a decision to detain the ship forthwith and to inspect it.

3.3 It is impracticable to define a sub-standard ship solely by reference to a list of qualifying defects. The inspector will have to exercise his professional judgement to determine whether to detain the ship until the deficiencies are corrected or to allow it to sail with certain deficiencies which are not vital to the safety of the ship, its crew or passengers, having regard to the particular circumstances of the intended voyage.

4 Submission of information to a port State about a sub-standard ship

4.1 Information that a ship appears to be sub-standard may be submitted to the appropriate authorities of the port State (see 4.4) by a member of crew, a professional body, an association, a trade union or any other individual with an interest in the safety of the ship, its crew and passengers. So far as the crew is concerned, it would be advisable that the submission should be subscribed to by more than one member.

4.2 It is desirable that such information should be submitted in writing. This would permit proper documentation of the case and of the alleged deficiencies including the identification of the source of the information. When the information is passed verbally, it is preferable to require subsequently the filing of a written report, identifying for the purposes of the port State's records the individual or body providing the information.

4.3 Information which may cause an investigation to be made should be submitted as early as possible after the arrival of the ship giving adequate time to the authorities to act as necessary.

4.4 Each Contracting Government should determine which authorities should receive information on sub-standard ships and initiate action. Measures should be taken to ensure that information submitted to the wrong department should be promptly passed on by such department to the appropriate authority for action.

5 Action by port States in response to information about sub-standard ships

5.1 On receipt of information about a sub-standard ship, the authorities, after evaluating, in consultation with the master as appropriate, the seriousness of the information and the reliability of its source, should immediately investigate the matter and take the action required by the circumstances. Information judged by the authorities to be bona fide under the present procedures could constitute clear grounds for believing that the condition of the ship or its equipment does not correspond substantially with the particulars of the relevant certificates required by the applicable International Convention for the Safety of Life at Sea, or the International Convention on Load Lines, 1966, and the consequential need for inspection. Care should be taken to avoid any undue delay to the ship.

5.2 Authorities which receive information about a sub-standard ship which could give rise to intervention should forthwith notify any maritime, consular and/or diplomatic representatives of the flag State in the area of the ship and request them to initiate or co-operate with investigations. Likewise, the classification society which has issued the relevant certificates on behalf of the flag State should be notified. These provisions will not, however, relieve the authorities of the Contracting Government of the port State from the responsibility for taking appropriate action in accordance with its powers under the relevant Conventions.

5.3 If the port State receiving information is unable to take action because there is insufficient time or no inspectors can be made available before the ship sails, the information should be passed to the authorities of the country of the next appropriate port of call, to the flag State and also to the relevant classification society in that port, where appropriate.

6 Procedures to be followed after exercise of control

6.1 The authorities of port States which have exercised control giving rise to intervention of any kind, whether or not as a result of information about a sub-standard ship, should forthwith notify any maritime, consular and/or diplomatic representatives of the flag State in the area of the ship of all the circumstances unless this is already done under 5.2. If such notification is made verbally, it should be subsequently confirmed, in writing. Likewise, the classification societies which have issued the relevant certificates on behalf of the flag State should be notified.

6.2 If the ship has been allowed to sail with known deficiencies, the authorities of the port State should communicate all the facts to the authorities of the country of the next appropriate port of call, to the flag State and to the relevant classification society, where appropriate. Lists of Addresses of Administrations to which the reports should be sent and of available inspection services are given in Appendix 3.

6.3 Contracting Governments, when they have exercised control giving rise to intervention of any kind, are urged to submit to the Organization reports in accordance with Regulation 19 of Chapter I of the applicable International Convention for the Safety of Life at Sea or Article 21 of the International Convention on Load Lines, 1966. Such deficiency reports should be made in accordance with the form given in Appendix 2.

6.4 Copies of deficiency reports made in accordance with paragraph 6.3 by Contracting Governments should, in addition to being forwarded to the Organization, be sent by the port State without delay to the authorities of the flag State and, where appropriate, to the classification society which had issued the relevant certificate. Deficiencies found which are not related to the applicable International Conventions for the Safety of Life at Sea, and the International Convention on Load Lines, 1966, should be submitted to flag States and/or to appropriate organizations but not to IMCO.

6.5 On receipt of such deficiency reports, the Administration of the flag State and/or, where appropriate, the classification society through that Administration, in addition to initiating any remedial action, is urged to forward comments to the Organization as soon as possible, preferably within three months after receipt. Such comments should be made in accordance with the form given in Appendix 2.

6.6 In the interest of making information regarding deficiencies and remedial measures generally available, a summary of such reports which have been received six months prior to every session of the Maritime Safety Committee should be prepared by the Secretariat, for consideration by the Maritime Safety Committee at every session, together with comments, if any, provided by the Administration of the flag State, which should include the reports of the classification society, if any. Copies of the reports should be circulated also to Contracting Governments which are not Members of IMCO.

6.7 In the summary of deficiency reports an indication should be given (flag State action) as to whether a comment by the flag State concerned is outstanding (comment). Deficiency reports upon which expected flag State comments are outstanding shall be repeated in consecutive summaries of deficiency reports until such comments have been received. Before repeating such deficiency reports in subsequent summaries, the Secretariat should remind flag States concerned of any outstanding comments.

6.8 While Article 21 of the International Convention on Load Lines, 1966, does not provide for the submission of deficiency reports to the Organization, it is recommended that such reports should be made and submitted in accordance with the Procedures for the Control of Ships and the Guidelines on Control Procedures, where failure to comply with the convention requirements has led to an intervention by a port State.

APPENDIX 1

GUIDELINES ON CONTROL PROCEDURES

General

1 In the exercise of control functions the surveyor will have to use his professional judgement to determine whether to detain the ship until the deficiencies are corrected or to allow it to sail with certain deficiencies which are not vital to the safety of the ship, its crew or passengers, having regard to the particular circumstances of the intended voyage. The following notes are intended to be used for the guidance of surveyors mainly in connexion with the physical condition of a ship and its equipment. Nevertheless the surveyor should also take into account the requirement of Regulation 13, Chapter V of the applicable International Convention for the Safety of Life at Sea that all ships shall be sufficiently and efficiently manned.

2 In the pursuance of control procedures under Regulation 19 of Chapter I of the applicable International Convention for the Safety of Life at Sea, or Article 21 of the International Convention on Load Lines, 1966, which, for instance, may arise from information given to a port State regarding a sub-standard ship, an authorized surveyor may proceed to the ship and before boarding gain, from its appearance in the water, an impression of its standard of maintenance from items such as the condition of its paintwork, corrosion or pitting and unrepaired damage.

Year of build

3 At the earliest possible time the surveyor should ascertain the year of build for the purpose of determining which conventions are applicable and to indicate that information in the report.

4 On boarding and introduction to the master or responsible ship's officer, he should examine all SOLAS Convention and Load Line Convention certificates. He should also take note of any requirements placed on the certificates by the flag State indicating which convention requirements for new ships shall be applied to their existing ships. If the certificates are valid and his general impressions and his visual observations on board confirm a good standard of maintenance he should generally confine his inspection to any reported deficiencies.

Inspection

5 If, however, the surveyor from his general impressions or observations on board has clear grounds for believing that the ship might be sub-standard, he should proceed to a more detailed inspection, taking the following considerations into account.

Structure

6 His impression of shell maintenance and the general state on deck, the condition of such items as ladderways, guardrails, pipe coverings, and areas of corrosion or pitting should influence his decision as to whether it is necessary to make the fullest possible examination of the structure with the ship afloat. Significant areas of damage or corrosion, or pitting of plating and associated stiffening in decks and hull affecting seaworthiness or strength to take local loads, may justify detention. It may be necessary for the underwater portion of the ship to be checked. In reaching his decision, the surveyor should have regard to the seaworthiness and not the age of the ship, making an allowance for fair wear and tear over the minimum acceptable scantlings. Damage not affecting seaworthiness will not constitute grounds for judging that a ship should be detained, nor will damage that has been temporarily but effectively repaired for a voyage to a port for permanent repairs. However, in his assessment of the effect of damage the surveyor should have regard to the location of crew accommodation and whether the damage substantially affects its habitability.

Machinery spaces

7 The condition of the machinery and of the electrical installations should be such that they are capable of providing sufficient continuous power for propulsion and for auxiliary services.

8 During inspection of the machinery spaces, the surveyor will form an impression of the standard of maintenance. Frayed or disconnected quick closing valve wires, disconnected or inoperative extended control rods or machinery trip mechanisms, missing valve handwheels, evidence of chronic steam, water and oil leaks, dirty tank tops and bilges or extensive corrosion of machinery foundations are pointers to an unsatisfactory organization. A large number of temporary repairs including pipe clips or cement boxes will indicate reluctance to make permanent repairs.

9 While it is not possible to determine the condition of the machinery without performance trials, general deficiencies such as leaking pump glands, dirty water gauge glasses, inoperable pressure gauges, rusted relief valves, inoperative or disconnected safety or control devices, evidence of repeated operation of diesel engine scavenge belt or crankcase relief valves, malfunctioning or inoperative automatic equipment and alarm systems, and leaking boiler casings or uptakes, would warrant inspection of the engine room log-book and investigation into the record of machinery failures and accidents and a request for running tests of machinery.

10 If one electrical generator is out of commission, the inspector should investigate whether power is available to maintain essential and emergency services and should make tests.

11 If evidence of neglect becomes evident, the surveyor should extend the scope of his investigation to include, for example, tests on the main and auxiliary steering gear arrangements, overspeed trips, circuit breakers, etc.

12 It must be stressed that while detection of one or more of the above deficiencies would afford guidance to a sub-standard condition, the actual combination is a matter for professional judgement in each case.

Conditions of assignment of load lines

13 It may be that the surveyor has concluded that a hull inspection is unnecessary but, if dissatisfied, on the basis of his observations on deck, with items such as defective hatch closing arrangements, corroded air pipes and vent coamings, he should examine closely the conditions of assignment of load lines, paying particular attention to closing appliances, means of freeing water from the deck and arrangements concerned with the protection of the crew.

Life-saving appliances

14 The effectiveness of life-saving appliances depends heavily on good maintenance by the crew and their use in regular drills. The lapse of time since the last survey for a Safety Equipment Certificate can be a significant factor in the degree of deterioration of equipment if it has not been subject to regular inspection by the crew. Apart from failure to carry equipment required by a Convention or obvious defects such as holed lifeboats, the surveyor should look for signs of disuse of, or obstructions to, boat launching equipment which may include paint accumulation, seizing of pivot points, absence of greasing, condition of blocks and falls and improper lashing or stowing of deck cargo.

15 Should such signs be evident, he would be justified in making a reasonably detailed inspection of all life-saving appliances. Such an examination might include the lowering of boats, a check on the servicing of liferafts, the number and condition of life-jackets and lifebuoys and ensuring that the pyrotechnics are still within their period of validity. It would not normally be as detailed as that for a renewal of the Safety Equipment Certificate and would concentrate on essentials for safe abandonment of the ship, but in an extreme case could progress to a full Safety Equipment Certificate inspection. The provision and functioning of effective outside lighting, means of alerting the crew and provision of illuminated routes to embarkation positions should be given importance in the inspection.

Fire safety

16 *Ships in general:* The poor condition of fire and wash deck lines and hydrants and the possible absence of fire hoses and extinguishers in accommodation spaces might be a guide to a need for a close inspection of all fire safety equipment. Even on a ship which is otherwise well regulated and maintained, the effectiveness of the emergency fire pump can be suspect. However, if the fire pump is inoperable, this in itself would not constitute grounds for judging the ship as sub-standard, but the ship should not be permitted to sail until the fire pump is operable or some alternative means is provided. In addition to compliance with convention requirements the surveyor should look for evidence of a higher than normal fire risk; this might be brought about by a poor standard of cleanliness in the machinery space, which together with significant deficiencies of fixed or portable fire-extinguishing equipment could lead to a judgement of the ship being sub-standard.

17 *Passenger ships:* Having regard to the annual survey requirements applicable to passenger ships with convention certificates, the number of such ships likely to qualify for consideration as sub-standard should be small in relation to cargo ships. However, the surveyor should initially form his opinion of the need for inspection of the fire safety arrangements on the basis of his consideration of the ship under the previous headings and, in particular, that dealing with fire safety equipment. If the surveyor considers that a more detailed survey of fire safety arrangements is necessary, he should examine the fire control plan on board in order to obtain a general picture of the fire safety measures provided in the ship and consider their compliance with convention requirements for the year of build. Queries on the method of structural protection should be addressed to the flag Administration and the surveyor should generally confine his inspection to the effectiveness of the arrangements provided.

18 The spread of fire could be accelerated if fire doors are not readily operable. The surveyor might inspect for their operability and securing arrangements those doors in main zone bulkheads and stairway enclosures and in boundaries of high fire risk spaces such as main machinery rooms and galleys, giving particular attention to those retained in the open position. Attention should also be given to main vertical zones which may have been compromised through new construction. An additional hazard in the event of fire is the spread of smoke through ventilation systems. Spot checks might be made on dampers and smoke flaps to ascertain the standard of operability. The surveyor might also ensure that ventilation fans can be stopped from the master controls and that means are available for closing main inlets and outlets of ventilation systems.

19 Attention should be given to the effectiveness of escape routes by ensuring that vital doors are not maintained locked and that alleyways and stairways are not obstructed.

Regulations for Preventing Collisions at Sea

20 A vital aspect of ensuring safety of life at sea is full compliance with the Collision Regulations. In his observations on deck the surveyor should consider the need for close inspection of lanterns and their screening and means of making sound and distress signals.

Cargo Ship Safety Construction Certificate

21 The general condition of the ship may lead the surveyor to consider matters other than those concerned with safety equipment and assignment of load lines, but nevertheless associated with the safety of the vessel, such as the effectiveness of items associated with the Cargo Ship Safety Construction Certificate, which can include pumping arrangements, means for shutting off air and oil supplies in the event of fire, alarm systems and emergency power supplies.

Cargo Ship Safety Radio Certificates

22 The validity of the Cargo Ship Safety Radiotelegraphy or Safety Radiotelephony Certificate may be accepted as proof of the provision and effectiveness of its associated equipment but the surveyor should ensure that appropriate certificated personnel are carried for its operation and for listening periods. The radio log should be examined to confirm that mandatory safety radio watches are being maintained.

Equipment in excess of convention or flag State requirements

23 Equipment on board which is expected to be relied on in situations affecting safety or pollution prevention must be in operating condition. If such equipment is inoperative and is in excess of the equipment required by an appropriate convention and/or the flag State it should be repaired, removed or, if removal is not practicable, clearly marked as inoperative and secured.

Temporary substitution of equipment

24 In any inspection concerned with the assessment of a ship, the surveyor should have as his objective the ensuring of conditions vital for the safety of the ship and its passengers and/or crew. This should be the determining factor in his judgement whether to detain. It may be that replacement equipment cannot be obtained without serious delay to the ship; in such a case, provided effective alternative means are substituted until convention requirements can be met, the ship should not be detained, always on the understanding that due promptness is observed in effecting replacements. A typical example is substitution of liferafts for a damaged boat; provided that means are also available for rescuing a man overboard, a ship should not be detained. However, the associated circumstances of the need for replacement of equipment should be considered in the surveyor's assessment of the ship.

Conclusion

25 The surveyor should ensure that all vital remedial measures are taken to safeguard the safety of the ship and its passengers and/or crew before permitting a ship to sail.

APPENDIX 2

PORT STATE REPORT ON DEFICIENCIES¹

(Issued in accordance with resolution A.466(XII))

1. Reporting country :
2. Name of ship type of ship²
3. Flag of ship
4. Gross tonnage year of build
5. Date and place of inspection 19
6. Nature of deficiency in relation to Convention requirements:
 - (a) *deficiency*³
 - (b) *Convention Regulation*⁴

¹ Deficiencies concerning matters not related to the applicable International Convention for the Safety of Life at Sea, and the International Convention on Load Lines, 1966, should be submitted to flag States and/or the organization concerned.

² Indicate whether passenger ship, cargo ship, bulk carrier, tanker, ro/ro vessel, fishing vessel, etc.

³ Refer only to the relevant parts or equipment of the ship which were found deficient (e.g. life-saving equipment, machinery and electrical installations, hull, radio installation, fire-fighting equipment, watertight integrity, etc.) as appropriate. Detailed deficiency report to be forwarded to the flag State without delay.

⁴ Quote the relevant convention Regulation (e.g. Regulation 9(a)(i), Chapter III, SOLAS 1974).

7. Relevant Certificates

(a) <i>title</i>	(b) <i>issuing authority</i>	(c) <i>dates of issue and expiry</i>
1.to
2.to
3.to
4.to
5.to

(d) *The information below concerning the last intermediate survey shall be provided if the next survey is due or overdue:*

1. Date: 19 ... Place:
by
(surveying Authority)
2. Date: 19 ... Place:
by
(surveying Authority)
3. Date: 19 ... Place:
by
(surveying Authority)
4. Date: 19 ... Place:
by
(surveying Authority)
5. Date: 19 ... Place:
by
(surveying Authority)

8. Brief note of action taken:⁵

.....
.....
.....
.....
.....
.....
.....
.....

9. Flag State, classification society and/or next port of call, as appropriately notified, as follows:⁶

.....
.....
.....
.....
.....

⁵ E.g. vessel detained, consul informed, Certificate withdrawn/renewed/extended, provisional certificate issued and conditions under which it was issued, next port of call informed, etc. . . .

⁶ Quote title and address of Administration and/or classification society

COMMENTS BY FLAG STATE ON DEFICIENCY REPORT

(Issued in accordance with resolution A.466(XII))

Deficiency report No:¹

Name of ship:

Flag State:

Gross tonnage:

Reporting country:

Classification society involved:

Brief note on remedial action taken:²

.....
.....
.....
.....
.....

¹ Quote symbol and report number of IMCO list of deficiency reports (e.g. MSC XLI/4, Annex 1, No. 48)

² Indicate also action, if any, regarding the relevant Certificates (e.g. extension, renewal, withdrawal, provisional and conditions).
