## GESAMP Working Group 41 on 'Ocean Interventions for Climate Change Mitigation' (formerly the Working Group on Marine Geoengineering)

### WG 41 objectives:

1. Better understand the potential environmental and socio-economic impacts of different marine climate intervention approaches: and
2. To provide advice to the London Protocol Parties to assist them in identifying those marine climate intervention techniques that it might be sensible to consider for listing in the new annex 4 of the Protocol

### WG 41 first phase:

Carried out a *'High level review of a wide range of proposed marine geoengineering techniques'*, published in March 2019.

This is the first study to comprehensively examine the many proposed ways in the marine environment to remove CO<sub>2</sub> from the atmosphere or boost the reflection of incoming solar radiation to space (termed "albedo modification") - or, in some cases, both.

3

## 1. GESAMP Working Group 41 Overall Objectives for the Second Phase of Work\*:

1. to better understand the potential environmental and societal impacts of different ocean interventions for climate change mitigation on the ocean;
2. to develop a framework to integrate inputs from natural sciences and societal disciplines into a holistic assessment of ocean interventions for climate change mitigation or other purposes; and
3. to provide advice to the London Protocol Parties to assist them in identifying those ocean interventions for climate change mitigation, or other purposes, consistent with the London Protocol's definition of marine geoengineering, that it might be prudent to consider for listing in the new Annex 4 of the Protocol.

4

## 2. GESAMP Working Group 41 – Key Terms of Reference\* - Part 1

1. Provide advice to the London Protocol Parties:
  - a) identifying promising ocean interventions for climate change mitigation or other purposes ...that might be worthwhile to consider for listing in the new annex 4 of the Protocol, including techniques having the potential to move to field testing;
  - b) developing an outline of the specific issues to be addressed in an assessment framework for each of a subset of techniques identified above, using the OFAF as a template;
  - c) providing an initial assessment of monitoring and verification approaches; and
  - d) identifying significant gaps in knowledge and uncertainties.

\* [http://www.gesamp.org/site/assets/files/1723/new\\_tor\\_wg41\\_as\\_approved.pdf](http://www.gesamp.org/site/assets/files/1723/new_tor_wg41_as_approved.pdf)

5

## 2. GESAMP Working Group 41 – Key Terms of Reference\* - Part 2

2. Develop a framework to integrate inputs from natural sciences and societal disciplines into a holistic assessment of ocean interventions for climate change mitigation or other purposes consistent with the London Protocol's definition of marine geoengineering;
3. Develop a flow chart and questionnaire with associated guidance to elicit information from proposers of ocean interventions for climate change mitigation or other purposes consistent with the London Protocol's definition of marine geoengineering, to enable a preliminary assessment (including constructive feedback) of their techniques by regulators, policy makers, funders or anyone considering or permitting proposals.

### 3. Integrated Assessment Framework - 1

Progress is being made with the framework. Points to note:

1. All discussions to date have been online;
2. A systems approach has been adopted as recommended by March 2019 workshop – see next slides;
3. Integrating natural and social sciences has been challenging and required a number of meetings to reach a common understanding e.g., issues of language;

7

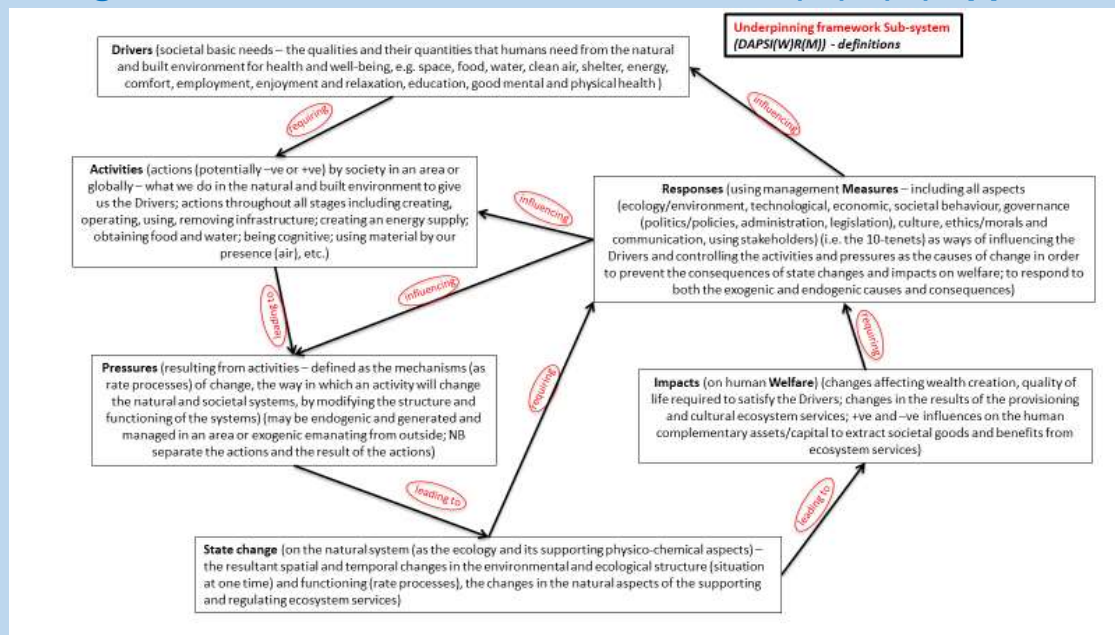

### 3. Integrated Assessment Framework - 2

The systems approach has been based on:

1. The DPSIR (Driver, Pressure, State, Impact and Response) approach that has been developed into the DAPSI(W)R(M) approach (Drivers, Activities, Pressures, State or State Changes, Impact (on Human Welfare), Response (as Management Measures) – Elliott et al. (2017).
2. The 10-tenets of adaptive management and sustainability – Barnard and Elliott (2015);
3. A German framework for assessing the feasibility of CO<sub>2</sub> options - Forster et al. (2022)

8

### 3. Integrated Assessment Framework - DAPSI(W)R(M) approach

9

### 3. Integrated Assessment Framework – The 10 Tenets

#### The 10 tenets:

**To be successful, management measures or responses to changes resulting from human activities should be:**

- Ecologically sustainable
- Technologically feasible
- Economically viable
- Socially desirable/tolerable
- Legally permissible
- Administratively achievable
- Politically expedient
- Ethically defensible (morally correct)
- Culturally inclusive
- Effectively communicable

## 4. Blue Carbon sub-group

- Mangroves, salt marshes and seagrass beds are often referred to as coastal blue carbon ecosystems and coastal seaweed beds can also be included in this definition.
- Marine sediments, in particular fine-grained ones, have been included within the definition of blue carbon by some authors. However, their significance for long-term sequestration is unclear.
- The sub-group agreed:
  - That there was no need to address restoration of coastal blue carbon ecosystems since there was much activity on this globally;
  - The sub-group agreed to focus its work on those ecosystems where it may be possible to increase natural sequestration rates, i.e., saltmarshes and mangroves e.g., placement of dredged material – Baptist et al. (2019). Suedel et al. (2021), CDR Academy (2023);
  - The other blue carbon ecosystems i.e., seagrasses and seaweed beds are those where we should encourage interventions associated with habitat protection, restoration and creation.
- However, note Williamson and Gattuso (2022) paper suggesting that carbon removal using coastal blue carbon ecosystems is uncertain and unreliable, with questionable climatic cost-effectiveness

Ocean manipulation to mitigate climate change may harm deep-sea ecosystems

By Lisa A. Levin<sup>1</sup>, John M. Altabe-Lucas<sup>2</sup>, Ana Colomo<sup>3</sup>, Erik E. Conner<sup>4</sup>, Neil Cross<sup>5</sup>, Robert Daiber<sup>6</sup>, Heidi-Jin Flower<sup>7</sup>, James Ingole<sup>8</sup>, Niels C. Meester<sup>9</sup>, Sarah Selkoe<sup>10</sup>, Andrew S. Truesdale<sup>11</sup>, Chris Votaw<sup>12</sup>, Morikiyo Yatsuhara<sup>13</sup>

Scientists, industry, and policy-makers have turned increasing attention toward the ocean as a source of climate change mitigation solutions. Efforts to develop ocean-based climate interventions (OBCIs) to remove and sequester carbon dioxide (CO<sub>2</sub>) manage solar radiation, or produce renewable energy have accelerated. Questions have been raised about OBCI costs, governance, impacts, and effectiveness at scale, but limited attention has been given to ocean biogeochemistry and ecosystems (1) and particularly to impacts on deep-sea ecosystems (>200-m water depth), an ocean region that is understudied but fundamental for Earth's healthy function. The deep sea, with low energy supply, typically cold, stable conditions, and a low density of organisms with reduced metabolism, requires specific attention. Here we discuss OBCIs that could affect deep-ocean ecosystems and their services, identify governance challenges, and highlight the need for an integrated research framework to help centralize consideration of deep-sea impacts in mitigation planning.

Science and governance gaps have featured broadly in past discussions of ocean vulnerability to anthropogenic pressures including overfishing, biodiversity loss, plastic pollution, climate change, acidification, and deoxygenation. Threats to the deep sea have emerged from oil spills, destructive bottom fisheries, and seabed mining. Many of these stand to be compounded or exacerbated by OBCIs. In addition, the massive deposition or transfer of particles, organic matter (OM), and CO<sub>2</sub> into the deep ocean from OBCIs present new biogeochemical and ecosystem threats
